This interdisciplinary course encompasses the fields of rock mechanics, structural geology, earthquake seismology and petroleum engineering, and covers a wide range of geomechanical problems that arise during the production of oil and gas reservoirs.

The course considers key practical issues such as prediction of well trajectories, estimation of hydrocarbon column heights and fault seal potential, design of optimally stable well trajectories, casing set points and mud weights, changes in reservoir performance during depletion, and production-induced faulting and subsidence. The first part of the course establishes the basic principles involved in a way that allows readers from different disciplinary backgrounds to understand the key concepts.

Reservoir Geomechanics is a practical course for geoscientists and engineers in the petroleum and geothermal industries, and for research scientists interested in stress measurements and their application to problems of faulting and fluid flow in the crust.

The course follows the text book, Reservoir Geomechanics by Prof. Zoback. The book is recommended, but not required for the course. It is available from Cambridge University Press and Amazon. It is also available electronic form via Kindle version.
